Queues

Queue data structure methods

The queue data structure has three main methods:

- enqueue (adds a node to the back of the queue)
- · dequeue (removes node at the front of the
- peek (returns value of node at the front of the queue, without removing it)

Queue follows FIFO protocol

A queue is a data structure composed of nodes, which follows a first in, first out (FIFO) protocol. This is analogous to a line at a grocery store, for which the first customer in the queue is the first to checkout.
